

INTEGRATION

1. INTRODUCTION

In these notes we develop theory of Bochner-Lebesgue integral. Our exhibition is to some extent different from the standard one. The first step is typical - we start with integration of nonnegative functions and we prove monotone convergence. Then we introduce Lebesgue's spaces and prove their completeness. Lebesgue's dominated convergence is presented as a result about convergence in Lebesgue's spaces. After this we introduce integral as a linear operator on Lebesgue's spaces. Final section resolves certain disambiguity in our notions.

Most of the theory of Lebesgue's spaces (this does not embrace Bochner's integral itself due to obvious reasons) works for Banach spaces defined over fields with absolute values. The reader may always assume for her convenience that the field is either \mathbb{C} or \mathbb{R} .

2. MEASURABLE SPACES AND MEASURES

In this section we introduce fundamental notions.

Definition 2.1. Let X be a set and let Σ be a family of its subsets. Suppose that Σ is closed under countable unions, complements and contains X . Then Σ is a σ -algebra of subsets of X .

Definition 2.2. A pair (X, Σ) consisting of a set X and a σ -algebra Σ of subsets of X is a *measurable space*.

Remark 2.3. Let X be a set and let $\{\Sigma_i\}_{i \in I}$ be a class of σ -algebras of subsets of X . Then

$$\bigcap_{i \in I} \Sigma_i$$

is a σ -algebra of subsets of X .

Remark 2.4. Let X be a set and let \mathcal{F} be a family of subsets of X . Then by Remark 2.3 there exists the smallest (with respect to inclusion) σ -algebra containing \mathcal{F} . We denote it by $\sigma(\mathcal{F})$ and call it the σ -algebra *generated* by \mathcal{F} .

Definition 2.5. Let (X, Σ) and (Y, Δ) be measurable spaces. A map $f : X \rightarrow Y$ is *measurable* if $f^{-1}(B) \in \Sigma$ for every $B \in \Delta$.

Definition 2.6. Let (X, Σ) be a measurable space and let $\mu : \Sigma \rightarrow [0, +\infty]$ be a function. Suppose that $\mu(\emptyset) = 0$ and

$$\mu \left(\bigcup_{n \in \mathbb{N}} A_n \right) = \sum_{n \in \mathbb{N}} \mu(A_n)$$

for every sequence $\{A_n\}_{n \in \mathbb{N}}$ of pairwise disjoint sets in Σ . Then μ is a *measure* on Σ .

Definition 2.7. A tuple (X, Σ, μ) consisting of a measurable space (X, Σ) and a measure μ on Σ is called a *space with measure*.

The next two notions relate measurable world with topological world. Reader trained in category theory may notice that we define a functor below.

Definition 2.8. Let X be a topological space. Then the σ -algebra $\mathcal{B}(X)$ generated by all open sets of X is called the σ -algebra of *Borel subsets* of X .

Definition 2.9. Let (X, Σ) be a measurable space and let Y be a topological space. A map $f : X \rightarrow Y$ is *measurable* if f is a measurable map $(X, \Sigma) \rightarrow (Y, \mathcal{B}(Y))$, where $\mathcal{B}(Y)$ is the σ -algebra of Borel sets on Y .

Finally we use the following notation related to pointwise limits of sequences of maps.

Definition 2.10. Let X be a set and let Y be a topological space. Consider a map $f : X \rightarrow Y$ and a sequence $\{f_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ of maps. If

$$f(x) = \lim_{n \rightarrow +\infty} f_n(x)$$

then $\{f_n\}_{n \in \mathbb{N}}$ is *pointwise convergent* to f . In this case we write

$$f = \lim_{n \rightarrow +\infty} f_n$$

3. MEASURABLE FUNCTIONS WITH VALUES IN EXTENDED REAL HALF LINE

Let $[0, +\infty]$ be the completion of $[0, +\infty)$ to linearly ordered set with the smallest and the greatest elements. Clearly $[0, +\infty]$ is a complete linear order. Note that $[0, +\infty)$ is a monoid with respect to the usual addition of real numbers. Then $[0, +\infty]$ admits a unique commutative monoid structure such that $[0, +\infty) \hookrightarrow [0, +\infty]$ is a homomorphism of monoids and $+\infty$ is an absorbing element. Moreover, elements of $[0, +\infty]$ can be multiplied by scalars from $[0, +\infty)$ according to formula

$$r \cdot (+\infty) = \begin{cases} (+\infty) & \text{if } r \in (0, +\infty) \\ 0 & \text{if } r = 0 \end{cases}$$

Finally $[0, +\infty]$ with the order topology is the one point compactification of $[0, +\infty)$.

Definition 3.1. Let X be a set and let $f : X \rightarrow [0, +\infty]$ be a function. Then f is *nonnegative* on X .

Let $\{f_n\}_{n \in \mathbb{N}}$ be a sequence of nonnegative functions on a set X . We define nonnegative functions $\sup_{n \in \mathbb{N}} f_n$ and $\inf_{n \in \mathbb{N}} f_n$ by formulas

$$\left(\sup_{n \in \mathbb{N}} f_n \right) (x) = \sup_{n \in \mathbb{N}} f_n(x), \quad \left(\inf_{n \in \mathbb{N}} f_n \right) (x) = \inf_{n \in \mathbb{N}} f_n(x)$$

for every $x \in X$. We define also functions

$$\limsup_{n \rightarrow +\infty} f_n = \inf_{m \in \mathbb{N}} \sup_{n \geq m} f_n, \quad \liminf_{n \rightarrow +\infty} f_n = \sup_{m \in \mathbb{N}} \inf_{n \geq m} f_n$$

If

$$\liminf_{n \rightarrow +\infty} f_n = \limsup_{n \rightarrow +\infty} f_n$$

then $\{f_n\}_{n \in \mathbb{N}}$ is pointwise convergent.

Let X be a set and let f, g be nonnegative functions on X . We write $f \leq g$ if $f(x) \leq g(x)$ for all $x \in X$.

Definition 3.2. Let X be a set. A sequence $\{f_n\}_{n \in \mathbb{N}}$ of nonnegative functions on X is *nondecreasing* if $f_n \leq f_m$ for all pairs $n, m \in \mathbb{N}$ such that $n \leq m$.

Proposition 3.3. Let (X, Σ) be a measurable space and let $\{f_n\}_{n \in \mathbb{N}}$ be a sequence of nonnegative and measurable functions on X . Then functions $\sup_{n \in \mathbb{N}} f_n$, $\inf_{n \in \mathbb{N}} f_n$ are measurable.

Proof. We prove the proposition for $\sup_{n \in \mathbb{N}} f_n$. The proof for $\inf_{n \in \mathbb{N}} f_n$ is similar. Fix $r \in (0, +\infty)$ and note that

$$\{x \in X \mid \sup_{n \in \mathbb{N}} f_n(x) > r\} = \bigcup_{q \in \mathbb{Q}, q > r} \bigcup_{n \in \mathbb{N}} \{x \in X \mid f_n(x) \geq q\}$$

Therefore, we derive that $f = \sup_{n \in \mathbb{N}} f_n$ satisfies $f^{-1}((r, +\infty]) \in \Sigma$. Family of all left-open infinite intervals in $[0, +\infty]$ generate $\mathcal{B}([0, +\infty])$. Hence f is measurable. \square

Corollary 3.4. Let (X, Σ) be a measurable space and let $\{f_n\}_{n \in \mathbb{N}}$ be a sequence of nonnegative and measurable functions on X . Then functions

$$\liminf_{n \rightarrow +\infty} f_n, \limsup_{n \rightarrow +\infty} f_n$$

are measurable. In particular, if $\{f_n(x)\}_{n \in \mathbb{N}}$ is convergent for every $x \in X$, then also

$$\lim_{n \rightarrow +\infty} f_n$$

is measurable.

Proof. Follows directly from Proposition 3.3 and definitions. \square

Definition 3.5. Let X be a set and let A be its subset. Then

$$\mathbb{1}_A(x) = \begin{cases} 1 & \text{if } x \in A \\ 0 & \text{if } x \notin A \end{cases}$$

is the characteristic function of A .

Proposition 3.6. Let (X, Σ) be a measurable space and let f be a nonnegative and measurable function on X . Then there exists a sequence $\{s_n\}_{n \in \mathbb{N}}$ of nonnegative and measurable functions on X such that the following assertions hold.

- (1) $\{s_n\}_{n \in \mathbb{N}}$ is nondecreasing and pointwise convergent to f .
- (2) The image of s_n is finite subset of \mathbb{R} for each $n \in \mathbb{N}$.

Proof. For every $n \in \mathbb{N}$ and integer $0 \leq k < n \cdot 2^n$ we define

$$A_{n,k} = f^{-1} \left(\left[\frac{k}{2^n}, \frac{k+1}{2^n} \right) \right)$$

Then $A_{n,k}$ is a measurable set. We define

$$s_n(x) = \sum_{k=0}^{n \cdot 2^n - 1} \frac{k}{2^n} \cdot \mathbb{1}_{A_{n,k}}$$

Then each s_n is a nonnegative and measurable function on X such that $s_n(X)$ is a finite subset of \mathbb{R} . Moreover, we have $|s_n(x) - f(x)| \leq \frac{1}{2^n}$ for every $x \in X$ such that $f(x) \leq n$ and $s_n(x) = n$ if $f(x) > n$. It follows that $\{s_n\}_{n \in \mathbb{N}}$ converges pointwise to f . This completes the proof. \square

4. LEBESGUE'S INTEGRAL OF NONNEGATIVE FUNCTIONS

Definition 4.1. Let (X, Σ, μ) be a space with measure. A nonnegative and measurable function s on X such that $s(X)$ is a finite subset of \mathbb{R} and

$$\mu(\{x \in X \mid s(x) \neq 0\}) \in \mathbb{R}$$

is a μ -simple function on X .

Definition 4.2. Let (X, Σ, μ) be a space with measure and let s be a μ -simple function on X . Then

$$\int_X s d\mu = \sum_{y \in [0, +\infty)} y \cdot \mu(s^{-1}(y))$$

is the *integral* of s with respect to μ .

Fact 4.3. Let (X, Σ, μ) be a space with measure and let s_1, s_2 be μ -simple functions on X . Then the following assertions hold.

(1) If $a, b \in \mathbb{R}$ and $a, b \geq 0$, then $as_1 + bs_2$ is a μ -simple function and

$$\int_X (as_1 + bs_2) d\mu = a \int_X s_1 d\mu + b \int_X s_2 d\mu$$

(2) If $s_1 \leq s_2$, then

$$\int_X s_1 d\mu \leq \int_X s_2 d\mu$$

Proof. Left for the reader as an exercise. \square

Definition 4.4. Let f be a nonnegative and measurable function on a space (X, Σ, μ) with measure. Then we define

$$\int_X f d\mu = \sup \left\{ \int_X s d\mu \mid s \text{ is a } \mu\text{-simple function on } X \text{ and } s \leq f \right\}$$

We call it the *integral* of f with respect to μ .

Fact 4.5. Let f, g be nonnegative and measurable functions on a space (X, Σ, μ) with measure. If $f \leq g$, then

$$\int_X f d\mu \leq \int_X g d\mu$$

Proof. Left for the reader as an exercise. \square

Theorem 4.6 (Monotone Convergence Theorem). Let $\{f_n\}_{n \in \mathbb{N}}$ be a sequence of nonnegative and measurable functions on a space (X, Σ, μ) with measure. Assume that $\{f_n\}_{n \in \mathbb{N}}$ is nondecreasing and let f be a nonnegative function which is its pointwise limit. Then f is a nonnegative and measurable function and

$$\lim_{n \rightarrow +\infty} \int_X f_n d\mu = \int_X f d\mu$$

Proof. By Corollary 3.4 function f is measurable and nonnegative. By Fact 4.5 we deduce that

$$\int_X f_n d\mu \leq \int_X f_{n+1} d\mu \leq \int_X f d\mu$$

for every $n \in \mathbb{N}$ and hence

$$\lim_{n \rightarrow +\infty} \int_X f_n d\mu \leq \int_X f d\mu$$

Fix a number $\alpha \in (0, 1)$. Pick a μ -simple function s on X such that $s \leq f$. Consider the set

$$A_n = \{x \in X \mid f_n(x) < \alpha s(x)\}$$

Then $A_n \in \Sigma$ for every $n \in \mathbb{N}$. Since $\{f_n\}_{n \in \mathbb{N}}$ is nondecreasing sequence, we derive that $\{A_n\}_{n \in \mathbb{N}}$ is nonincreasing sequence of sets. Since $s(X)$ is a finite subset of \mathbb{R} and

$$s(x) \leq f(x) = \lim_{n \rightarrow +\infty} f_n(x)$$

we derive that

$$\bigcap_{n \in \mathbb{N}} A_n = \emptyset, A_1 \subseteq \{x \in X \mid s(x) \neq 0\}$$

In particular, $\mu(A_1) \in \mathbb{R}$ and

$$\lim_{n \rightarrow +\infty} \mu(A_n) = 0$$

We have inequality

$$\alpha \int_X s d\mu = \int_X \alpha s d\mu = \int_X \mathbb{1}_{X \setminus A_n} \cdot (\alpha \cdot s) d\mu + \int_X \mathbb{1}_{A_n} \cdot (\alpha \cdot s) d\mu \leq$$

$$\leq \int_X f_n d\mu + \mu(A_n) \cdot \alpha \cdot \sup_{x \in X} s(x) = \int_X f_n d\mu + \mu(A_n) \cdot \alpha \cdot \sup_{x \in X} s(x)$$

By virtue of

$$\lim_{n \rightarrow +\infty} \mu(A_n) = 0$$

we have

$$\alpha \int_X s d\mu \leq \lim_{n \rightarrow +\infty} \int_X f_n d\mu$$

Since s is an arbitrary μ -simple function such that $s \leq f$, we deduce that

$$\alpha \int_X f d\mu \leq \lim_{n \rightarrow +\infty} \int_X f_n d\mu$$

Finally for $\alpha \rightarrow 1$ we obtain

$$\int_X f d\mu \leq \lim_{n \rightarrow +\infty} \int_X f_n d\mu$$

and this completes the proof. \square

The theorem above is a reason why Lebesgue's integration theory is such a powerful tool.

Theorem 4.7 (Fatou's lemma). *Let $\{f_n\}_{n \in \mathbb{N}}$ be a sequence of nonnegative and measurable functions on a space (X, Σ, μ) with measure. Then*

$$\int_X \liminf_{n \rightarrow +\infty} f_n d\mu \leq \liminf_{n \rightarrow +\infty} \int_X f_n d\mu$$

Proof. For every $m \in \mathbb{N}$ denote $\inf_{n \geq m} f_n$ by g_m . Corollary 3.4 implies that $\{g_m\}_{m \in \mathbb{N}}$ is a non-decreasing sequence of nonnegative and measurable functions on (X, Σ) . By Theorem 4.6 we have

$$\int_X \liminf_{n \rightarrow +\infty} f_n d\mu = \lim_{m \rightarrow +\infty} \int_X \inf_{n \geq m} f_n d\mu = \lim_{m \rightarrow +\infty} \int_X g_m d\mu = \int_X \lim_{m \rightarrow +\infty} g_m d\mu = \int_X \liminf_{n \rightarrow +\infty} f_n d\mu$$

\square

Proposition 4.8. *Let f, g be a nonnegative and measurable functions on a space (X, Σ, μ) with measure. Fix numbers $a, b \in \mathbb{R}$ and $a, b \geq 0$. Then the function $af + bg$ is measurable and*

$$\int_X (af + bg) d\mu = a \int_X f d\mu + b \int_X g d\mu$$

Proof. By Proposition 3.6 there exist nondecreasing sequences $\{s_n\}_{n \in \mathbb{N}}$ and $\{t_n\}_{n \in \mathbb{N}}$ of nonnegative, measurable functions such that

(1) $s_n(X), t_n(X)$ are finite subsets of \mathbb{R} for each $n \in \mathbb{N}$.

(2)

$$f = \lim_{n \rightarrow +\infty} s_n, g = \lim_{n \rightarrow +\infty} t_n$$

It follows that

$$\lim_{n \rightarrow +\infty} (as_n + bt_n) = af + bg$$

Thus $af + bg$ is measurable by Corollary 3.4. By definition

$$a \int_X f d\mu + b \int_X g d\mu \leq \int_X (af + bg) d\mu$$

Hence if one of the integrals

$$\int_X f d\mu, \int_X g d\mu$$

is infinite, then the assertion holds. Suppose that both integrals are finite. Then $\{s_n\}_{n \in \mathbb{N}}$ and $\{t_n\}_{n \in \mathbb{N}}$ consist of μ -simple functions. By Theorem 4.6 and Fact 4.3 we have

$$\begin{aligned} \int_X (af + bg) d\mu &= \lim_{n \rightarrow +\infty} \int_X (as_n + bt_n) d\mu = \lim_{n \rightarrow +\infty} \left(a \int_X s_n d\mu + b \int_X t_n d\mu \right) = \\ &= a \left(\lim_{n \rightarrow +\infty} \int_X s_n d\mu \right) + b \left(\lim_{n \rightarrow +\infty} \int_X t_n d\mu \right) = a \int_X f d\mu + b \int_X g d\mu \end{aligned}$$

□

5. HÖLDER AND MINKOWSKI INTEGRAL INEQUALITIES

Theorem 5.1 (Hölder). *Let (X, Σ, μ) be a space with measure and let $p, q \in (1, +\infty)$ satisfy*

$$\frac{1}{p} + \frac{1}{q} = 1$$

If f, g are nonnegative and measurable functions on (X, Σ, μ) , then

$$\int_X f \cdot g d\mu \leq \left(\int_X f^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X g^q d\mu \right)^{\frac{1}{q}}$$

For the proof we need the following lemma.

Lemma 5.1.1. *Let a, b be nonnegative extended real numbers and let $p, q \in (1, +\infty)$ satisfy*

$$\frac{1}{p} + \frac{1}{q} = 1$$

Then

$$a^{\frac{1}{p}} \cdot b^{\frac{1}{q}} \leq \frac{a}{p} + \frac{b}{q}$$

Proof of the lemma. Without loss of generality we may assume that $a, b \in \mathbb{R}_+$. Next the inequality in the question is equivalent with

$$\frac{\ln a}{p} + \frac{\ln b}{q} \leq \ln \left(\frac{a}{p} + \frac{b}{q} \right)$$

and this inequality is an instance of Jensen's inequality, since

$$\frac{1}{p} + \frac{1}{q} = 1$$

and logarithm is concave. □

Proof of the theorem. We may assume that

$$\left(\int_X f^p d\mu \right)^{\frac{1}{p}}, \left(\int_X g^q d\mu \right)^{\frac{1}{q}} \in \mathbb{R}_+$$

By Lemma 5.1.1 we have

$$\frac{f(x) \cdot g(x)}{\left(\int_X f^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X g^q d\mu \right)^{\frac{1}{q}}} = \left(\frac{f(x)^p}{\int_X f^p d\mu} \right)^{\frac{1}{p}} \cdot \left(\frac{g(x)^q}{\int_X g^q d\mu} \right)^{\frac{1}{q}} \leq \frac{1}{p} \cdot \frac{f(x)^p}{\int_X f^p d\mu} + \frac{1}{q} \cdot \frac{g(x)^q}{\int_X g^q d\mu}$$

for every $x \in X$. Integrating both sides with respect to μ yields

$$\frac{\int_X f \cdot g d\mu}{\left(\int_X f^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X g^q d\mu \right)^{\frac{1}{q}}} \leq \frac{1}{p} + \frac{1}{q} = 1$$

and hence the inequality in the statement holds. □

Corollary 5.2 (Minkowski). *Let (X, Σ, μ) be a space with measure and let $p \in [1, +\infty)$. Suppose that f, g are nonnegative and measurable functions on (X, Σ, μ) . Then*

$$\left(\int_X (f + g)^p d\mu \right)^{\frac{1}{p}} \leq \left(\int_X f^p d\mu \right)^{\frac{1}{p}} + \left(\int_X g^p d\mu \right)^{\frac{1}{p}}$$

Proof. The case $p = 1$ follows from Proposition 4.8. Thus we assume that $p \in (1, +\infty)$. Suppose that $p \in [1, +\infty)$. Note that if $q \in [1, +\infty)$ satisfies

$$\frac{1}{p} + \frac{1}{q} = 1$$

then $q = \frac{p}{p-1}$. Hence by Theorem 5.1 we have

$$\int_X f \cdot (f + g)^{p-1} d\mu \leq \left(\int_X f^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X (f + g)^{(p-1) \cdot q} d\mu \right)^{\frac{1}{q}} = \left(\int_X f^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X (f + g)^p d\mu \right)^{1 - \frac{1}{p}}$$

and

$$\int_X g \cdot (f + g)^{p-1} d\mu \leq \left(\int_X g^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X (f + g)^{(p-1) \cdot q} d\mu \right)^{\frac{1}{q}} = \left(\int_X g^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X (f + g)^p d\mu \right)^{1 - \frac{1}{p}}$$

Thus

$$\begin{aligned} \int_X (f + g)^p d\mu &= \int_X (f + g) \cdot (f + g)^{p-1} d\mu = \int_X f \cdot (f + g)^{p-1} d\mu + \int_X g \cdot (f + g)^{p-1} d\mu \leq \\ &\leq \left(\int_X f^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X (f + g)^p d\mu \right)^{1 - \frac{1}{p}} + \left(\int_X g^p d\mu \right)^{\frac{1}{p}} \cdot \left(\int_X (f + g)^p d\mu \right)^{1 - \frac{1}{p}} \end{aligned}$$

dividing both sides by

$$\left(\int_X (f + g)^p d\mu \right)^{1 - \frac{1}{p}}$$

yields

$$\left(\int_X (f + g)^p d\mu \right)^{\frac{1}{p}} \leq \left(\int_X f^p d\mu \right)^{\frac{1}{p}} + \left(\int_X g^p d\mu \right)^{\frac{1}{p}}$$

This completes the proof. \square

Finally in the next section we also use the following integral inequality.

Proposition 5.3. *Let (X, Σ, μ) be a space with measure and let $p \in (0, +\infty)$. Suppose that f, g are nonnegative and measurable functions on (X, Σ, μ) . Then*

$$\left(\int_X (f + g)^p d\mu \right)^{c_p} \leq \left(\int_X f^p d\mu \right)^{c_p} + \left(\int_X g^p d\mu \right)^{c_p}$$

where

$$c_p = \begin{cases} 1 & \text{if } p \in (0, 1) \\ \frac{1}{p} & \text{if } p \in [1, +\infty) \end{cases}$$

Proof. For $p \in [1, +\infty)$ it is Corollary 5.2.

Assume that $p \in (0, 1)$. Pick elements $a, b \in [0, +\infty]$. Then

$$(a + b)^p \leq a^p + b^p$$

Hence

$$\int_X (f + g)^p d\mu \leq \int_X f^p d\mu + \int_X g^p d\mu$$

by Fact 4.5. \square

6. STRONGLY MEASURABLE FUNCTIONS

In this section we introduce a class of measurable functions which form the basis of integration in Banach spaces.

Proposition 6.1. *Let (Y, d) be a metric space and let (X, Σ) be a measurable space. Suppose that a sequence $\{f_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ of measurable functions is pointwise convergent to some function $f : X \rightarrow Y$. Then f is measurable.*

Proof. Let U be an open subset of Y . We define

$$U_k = \{y \in Y \mid \text{dist}(y, Y \setminus U) > 2^{-k}\}$$

for every $k \in \mathbb{N}$. Then $\{U_k\}_{k \in \mathbb{N}}$ are open subsets of Y . We have

$$f^{-1}(U) = \bigcup_{k \in \mathbb{N}} \bigcup_{m \in \mathbb{N}} \bigcap_{n \geq m} f_n^{-1}(U_k)$$

and the left hand side is clearly an element of Σ . Hence preimages of open subsets of Y under f are in Σ . Since σ -algebra $\mathcal{B}(Y)$ is generated by open sets, we derive the assertion. \square

We fix a field \mathbb{K} together with an absolute value $|\cdot|$. Suppose that Y is a normed vector space over \mathbb{K} and suppose that $\|\cdot\|$ is its norm. Let X be a set and let $f : X \rightarrow Y$ be a function. We define a nonnegative function $\|f\| : X \rightarrow [0, +\infty]$ by formula

$$\|f\|(x) = \|f(x)\|$$

for every $x \in X$.

Definition 6.2. Let Y be a normed vector space over \mathbb{K} and let (X, Σ) be a measurable space. A function $f : X \rightarrow Y$ is *strongly measurable* if it is measurable and $f(X)$ is a separable subspace of Y .

Proposition 6.3. *Let Y be a normed vector space over \mathbb{K} and let (X, Σ) be a measurable space. Suppose that a sequence $\{f_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ of strongly measurable functions is pointwise convergent to some function $f : X \rightarrow Y$. Then f is strongly measurable.*

Proof. According to Proposition 6.1 function f is measurable. Moreover, we have

$$f(X) \subseteq \text{cl}\left(\bigcup_{n \in \mathbb{N}} f_n(X)\right)$$

and hence $f(X)$ is a separable subspace of Y . Thus f is strongly measurable. \square

Proposition 6.4. *Let $n \in \mathbb{N}$ and let Y_0, \dots, Y_n be normed vector spaces over \mathbb{K} . Suppose that (X, Σ) is a measurable space and $f_i : X \rightarrow Y_i$ for $0 \leq i \leq n$ are strongly measurable functions. Then the function*

$$X \ni x \mapsto \left(f_0(x), \dots, f_n(x)\right) \in \prod_{i=0}^n Y_i$$

is strongly measurable.

Proof. Note that the family of open subsets of

$$\prod_{i=0}^n f_i(X)$$

is contained in σ -algebra generated by sets

$$\prod_{i=0}^n (U_i \cap f_i(X))$$

where U_i is an open subset of Y_i for $0 \leq i \leq n$. Indeed, this is a consequence of the fact that $f_i(X)$ are separable for $0 \leq i \leq n$. It follows that the function in question is measurable. Since finite product of separable metric spaces is separable, we derive that its image is separable. Hence the function in the statement is strongly measurable. \square

Corollary 6.5. *Let Y be a normed space over \mathbb{K} and let (X, Σ) be a measurable space. Let $f, g : X \rightarrow Y$ be strongly measurable functions. Then*

$$\alpha f + \beta g$$

is strongly measurable for all $\alpha, \beta \in \mathbb{K}$.

Proof. This is a consequence of Proposition 6.4 and the fact that Y is topological vector space over \mathbb{K} . Details are left for the reader. \square

Theorem 6.6. *Let Y be a normed space over \mathbb{K} and let (X, Σ) be a measurable space. Let $f : X \rightarrow Y$ be a function. Then the following assertions are equivalent.*

(i) *f is strongly measurable.*

(ii) *There exists a sequence $\{s_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ of measurable functions pointwise convergent to f such that $s_n(X) \subseteq Y$ is finite and the inequality*

$$\|f - s_n\| \leq \|f\|$$

holds for every $n \in \mathbb{N}$.

For the proof we need the following lemma.

Lemma 6.6.1. *Let $n, k \in \mathbb{N}$ satisfy $k \leq n$. Then*

$$\{(r_0, \dots, r_n) \in \mathbb{R}^{n+1} \mid \min_{0 \leq i \leq n} r_i < r_j \text{ for } j < k \text{ and } r_k = \min_{0 \leq i \leq n} r_i\} \subseteq \mathbb{R}^{n+1}$$

is a Borel subset.

Proof of the lemma. Left for the reader. \square

Proof of the theorem. Suppose that f is strongly measurable. Consider a countable subset $\{y_k\}_{k \in \mathbb{N}}$ of Y which closure contains $f(X)$ and assume that y_0 is zero in Y . From Proposition 6.4 we deduce that the function

$$X \ni x \mapsto \left(\|y_0 - f(x)\|, \dots, \|y_n - f(x)\| \right) \in \mathbb{R}^{n+1}$$

is measurable for each $n \in \mathbb{N}$. Thus by Lemma 6.6.1 the set

$$A_{n,k} = \{x \in X \mid \min_{0 \leq i \leq n} \|y_i - f(x)\| < \|y_j - f(x)\| \text{ for } j < k \text{ and } \|y_k - f(x)\| = \min_{0 \leq i \leq n} \|y_i - f(x)\|\}$$

is in Σ for all $k, n \in \mathbb{N}$ such that $k \leq n$. For $n \in \mathbb{N}$ we define a function $s_n : X \rightarrow Y$ by formula

$$s_n(x) = \sum_{k=0}^n y_k \cdot \mathbb{1}_{A_{n,k}}$$

Note that s_n is measurable and $s_n(X)$ is finite for $n \in \mathbb{N}$. Moreover, we have

$$\|s_n(x) - f(x)\| = \min_{0 \leq i \leq n} \|y_i - f(x)\|$$

for every $x \in X$. Thus

$$\lim_{n \rightarrow +\infty} s_n = f$$

and $\|s_n - f\| \leq \|f\|$. This completes the proof of (i) \Rightarrow (ii).

Suppose now that there exists a sequence $\{s_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ of measurable functions pointwise convergent to f such that $s_n(X) \subseteq Y$ is finite. Then Proposition 6.3 asserts that f is strongly measurable. This proves that (ii) \Rightarrow (i). \square

7. LEBESGUE SPACES

In this section we fix a positive real number p and a Banach space Y with norm $\|-\|$ over a field \mathbb{K} with absolute value $|\cdot|$.

Definition 7.1. Let $f : X \rightarrow Y$ be a strongly measurable function on a space (X, Σ, μ) with measure. Then

$$\|f\|_p = \left(\int_X \|f\|^p d\mu \right)^{\frac{1}{p}}$$

is the p -norm of f with respect to μ .

Definition 7.2. Let $f : X \rightarrow Y$ be a strongly measurable function on a space (X, Σ, μ) with measure. If

$$\|f\|_p \in \mathbb{R}$$

then f is p -th power integrable with respect to μ or shortly p -th power μ -integrable.

Definition 7.3. Let (X, Σ, μ) be a space with measure. Then the set of all Y -valued that are p -th power μ -integrable functions is denoted by $L^p(\mu, Y)$ and is called the *Lebesgue space of p -th power μ -integrable functions* for Y .

By Corollary 6.5 the set of all strongly measurable and Y -valued functions on a space (X, Σ) is a \mathbb{K} -vector space with respect to the usual operations. Our next goal is to show that $L^p(\mu, Y)$ is a \mathbb{K} -vector subspace of this space and to introduce the topology on $L^p(\mu, Y)$ which makes it into a topological vector space over \mathbb{K} .

Proposition 7.4. Let (X, Σ, μ) be a space with measure. Then $L^p(\mu, Y)$ is a \mathbb{K} -vector subspace of the \mathbb{K} -vector space of all strongly measurable functions on (X, Σ) . Moreover, the following assertions hold.

(1) If $p \in (0, 1)$, then

$$L^p(\mu, Y) \times L^p(\mu, Y) \ni (f, g) \mapsto \int_X \|f - g\|^p d\mu \in [0, +\infty]$$

is a translation invariant pseudometric on $L^p(\mu, Y)$.

(2) If $p \in [1, +\infty)$, then

$$\|-\|_p : L^p(\mu, Y) \rightarrow [0, +\infty]$$

is a seminorm.

Proof. Note that if $f \in L^p(\mu, Y)$ and $\alpha \in \mathbb{K}$, then

$$\|\alpha \cdot f\|_p = |\alpha| \cdot \|f\|_p$$

Hence if $f \in L^p(\mu, Y)$, then also $\alpha \cdot f \in L^p(\mu, Y)$ and moreover, the function $\|-\|_p$ is positively homogeneous. Next we separately handle cases $p \in (0, 1)$ and $p \in [1, +\infty)$.

Suppose that $p \in (0, 1)$. Then by Proposition 5.3 we have

$$\int_X (f + g)^p d\mu \leq \int_X f^p d\mu + \int_X g^p d\mu$$

for any two nonnegative and strongly measurable functions f, g on (X, Σ, μ) . Hence

$$f, g \in L^p(\mu, Y) \Rightarrow f + g \in L^p(\mu, Y)$$

and

$$L^p(\mu, Y) \times L^p(\mu, Y) \ni (f, g) \mapsto \int_X \|f - g\|^p d\mu \in [0, +\infty]$$

is a translation invariant pseudometric on $L^p(\mu, Y)$. This completes the proof for this case.

Suppose now that $p \in [1, +\infty)$. This case follows from Corollary 5.2. \square

For now on we consider $L^p(\mu, Y)$ as a topological vector \mathbb{K} -space with respect to topology described in Proposition 7.4.

Remark 7.5. Note that the sequence $\{f_n\}_{n \in \mathbb{N}}$ of elements of $L^p(\mu, Y)$ converges to $f \in L^p(\mu, Y)$ if and only if

$$\lim_{n \rightarrow +\infty} \|f_n - f\|_p d\mu = 0$$

and the space $L^p(\mu, Y)$ carries translation invariant pseudometric.

Theorem 7.6 (Riesz). *Let (X, Σ, μ) be a space with measure. If $\{f_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ is a Cauchy sequence of elements of $L^p(\mu, Y)$, then there exist an increasing sequence $\{n_k\}_{k \in \mathbb{N}}$ of natural numbers and a function $f : X \rightarrow Y$ which is p -th power μ -integrable such that*

$$\lim_{k \rightarrow +\infty} f_{n_k}(x) = f(x)$$

for all x outside some set in Σ of measure μ equal to zero. Moreover, $\{f_n\}_{n \in \mathbb{N}}$ converges to f in $L^p(\mu, Y)$.

Proof. We consider an increasing sequence $\{n_k\}_{k \in \mathbb{N}}$ of natural numbers such that

$$\int_X \|f_{n_{k+1}} - f_{n_k}\|^p d\mu \leq 4^{-k}$$

for every $k \in \mathbb{N}$. For $k \in \mathbb{N}$ consider a set

$$A_k = \{x \in X \mid \|f_{n_{k+1}}(x) - f_{n_k}(x)\|^p \geq 2^{-k}\}$$

in Σ . Then

$$2^{-k} \cdot \mu(A_k) \leq \int_X \|f_{n_{k+1}} - f_{n_k}\|^p d\mu \leq 4^{-k}$$

Hence $\mu(A_k) \leq 2^{-k}$ for each $k \in \mathbb{N}$. For $m \in \mathbb{N}$ we define

$$B_m = \bigcup_{k=m}^{+\infty} A_k$$

Then

$$\mu(B_m) = \mu\left(\bigcup_{k=m}^{+\infty} A_k\right) \leq \sum_{k=m}^{+\infty} \mu(A_k) \leq \sum_{k=m}^{+\infty} 2^{-k} = 2^{1-m}$$

and $\{B_m\}_{m \in \mathbb{N}}$ is a nonincreasing sequence of subsets of Σ . This proves that

$$B = \bigcap_{m \in \mathbb{N}} B_m$$

satisfy $\mu(B) = 0$. For $x \notin B_m$ we have

$$\sum_{k=m}^{+\infty} \|f_{n_{k+1}}(x) - f_{n_k}(x)\| \leq \sum_{k=m}^{+\infty} 2^{-\frac{k}{p}} = 2^{-\frac{m}{p}} \cdot \frac{2^{\frac{1}{p}}}{2^{\frac{1}{p}} - 1}$$

Since Y is a Banach space, we deduce that for $x \notin B_m$ series

$$f_{n_0}(x) + \sum_{k \in \mathbb{N}} (f_{n_{k+1}}(x) - f_{n_k}(x))$$

is convergent. Therefore, it is also convergent for $x \notin B$. We define $f : X \rightarrow Y$ as a sum of the series for $x \notin B$ and $f(x) = 0$ for $x \in B$. Then

$$\lim_{k \rightarrow +\infty} f_{n_k}(x) = f(x)$$

for $x \notin B$. Hence

$$\lim_{k \rightarrow +\infty} \mathbb{1}_{X \setminus B} \cdot f_{n_k} = f$$

and Proposition 6.3 asserts that f is a strongly measurable function. Moreover, by Theorem 4.6 and Proposition 5.3 we have

$$\begin{aligned} \left(\int_X \|f\|^p d\mu \right)^{c_p} &= \left(\int_X \mathbb{1}_{X \setminus B} \cdot \|f_{n_0} + \sum_{k \in \mathbb{N}} (f_{n_{k+1}} - f_{n_k})\|^p d\mu \right)^{c_p} \leq \\ &\leq \left(\int_X \left(\|f_{n_0}\| + \sum_{k \in \mathbb{N}} \|f_{n_{k+1}} - f_{n_k}\| \right)^p d\mu \right)^{c_p} \leq \left(\int_X \|f_{n_0}\|^p d\mu \right)^{c_p} + \sum_{k \in \mathbb{N}} \left(\int_X \|f_{n_{k+1}} - f_{n_k}\|^p d\mu \right)^{c_p} \leq \\ &\leq \left(\int_X \|f_{n_0}\|^p d\mu \right)^{c_p} + \sum_{k \in \mathbb{N}} 4^{-\frac{k}{c_p}} \end{aligned}$$

where c_p is some positive constant depending only on p . Thus $f \in L^p(\mu, Y)$. Again by Theorem 4.6 and Proposition 5.3 we have

$$\begin{aligned} \left(\int_X \|f - f_{n_m}\|^p d\mu \right)^{c_p} &= \left(\int_X \mathbb{1}_{X \setminus B} \cdot \left\| \sum_{k=m}^{+\infty} (f_{n_{k+1}} - f_{n_k}) \right\|^p d\mu \right)^{c_p} \leq \\ &\leq \left(\int_X \left\| \sum_{k=m}^{+\infty} (f_{n_{k+1}} - f_{n_k}) \right\|^p d\mu \right)^{c_p} \leq \sum_{k=m}^{\infty} \left(\int_X \|f_{n_{k+1}} - f_{n_k}\|^p d\mu \right)^{c_p} \leq \sum_{k=m}^{+\infty} 4^{-\frac{k}{c_p}} \end{aligned}$$

Therefore, $\{f_{n_k}\}_{k \in \mathbb{N}}$ converges to f in $L^p(\mu, Y)$. Since $\{f_n\}_{n \in \mathbb{N}}$ is a Cauchy sequence in $L^p(\mu, Y)$ with a subsequence convergent to f , we derive that $\{f_n\}_{n \in \mathbb{N}}$ converges to f in $L^p(\mu, Y)$. \square

Next theorem is a criterion connecting pointwise convergence and convergence in $L^p(\mu, Y)$.

Theorem 7.7 (Lebesgue's dominated convergence theorem). *Let (X, Σ, μ) be a space with measure and let $\{f_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ be a sequence of p -th power μ -integrable functions. Suppose that $f : X \rightarrow Y$ is a pointwise limit of $\{f_n\}_{n \in \mathbb{N}}$ and assume that there exists nonnegative and measurable function g on X such that $\|f_n\|^p \leq g$ holds for every $n \in \mathbb{N}$ and*

$$\int_X g d\mu \in \mathbb{R}$$

Then $f \in L^p(\mu, Y)$ and $\{f_n\}_{n \in \mathbb{N}}$ converges to f in $L^p(\mu, Y)$.

For the proof we need the following result.

Lemma 7.7.1. *Let f, g be a nonnegative and measurable functions on a space (X, Σ, μ) with measure. Suppose that $f \leq g$ and*

$$\int_X f d\mu, \int_X g d\mu \in \mathbb{R}$$

Then

$$\int_X (g - f) d\mu = \int_X g d\mu - \int_X f d\mu$$

Proof of the lemma. According to Proposition 4.8 we obtain that

$$\int_X g d\mu = \int_X ((g - f) + f) d\mu = \int_X (g - f) d\mu + \int_X f d\mu$$

Since integrals above are finite, we have

$$\int_X (g - f) d\mu = \int_X g d\mu - \int_X f d\mu$$

\square

Proof of the theorem. Since $\{f_n\}_{n \in \mathbb{N}}$ converges pointwise to f , we deduce that f is strongly measurable. Moreover, a sequence $\{\|f_n\|\}_{n \in \mathbb{N}}$ converges pointwise to $\|f\|$. Since $\|f_n\|^p \leq g$ holds for every $n \in \mathbb{N}$, we deduce that $\|f\|^p \leq g$. Thus

$$\int_X \|f\|^p d\mu \leq \int_X g d\mu \in \mathbb{R}$$

Hence $f \in L^p(\mu, Y)$.

Next note that

$$(a + b)^p \leq 2^p \cdot (a^p + b^p)$$

for $a, b \in [0, +\infty]$. Thus $\|f - f_n\|^p \leq 2^{p+1} \cdot g$ for every $n \in \mathbb{N}$. Hence by Theorem 4.7 and Lemma 7.7.1 we have

$$\begin{aligned} \int_X 2^{p+1} \cdot g d\mu - \int_X \limsup_{n \rightarrow +\infty} \|f - f_n\|^p d\mu &= \int_X (2^{p+1} \cdot g - \limsup_{n \rightarrow +\infty} \|f - f_n\|^p) d\mu = \\ &= \int_X \liminf_{n \rightarrow +\infty} (2^{p+1} \cdot g - \|f - f_n\|^p) d\mu \leq \liminf_{n \rightarrow +\infty} \int_X (2^{p+1} \cdot g - \|f - f_n\|^p) d\mu = \\ &= \int_X 2^{p+1} \cdot g d\mu - \limsup_{n \rightarrow +\infty} \int_X \|f - f_n\|^p d\mu \end{aligned}$$

Hence

$$\limsup_{n \rightarrow +\infty} \int_X \|f - f_n\|^p d\mu \leq \int_X \limsup_{n \rightarrow +\infty} \|f - f_n\|^p d\mu = 0$$

Thus we deduce that $\{f_n\}_{n \in \mathbb{N}}$ converges to f in $L^p(\mu, Y)$. \square

It turns out that Lebesgue's space $L^p(\mu, Y)$ contains certain dense subspace which can be easily described. We shall define this space and then prove that in fact it is dense.

Definition 7.8. Let (X, Σ, μ) be a space with measure. A measurable function $s : X \rightarrow Y$ such that $s(X) \subseteq Y$ is finite and

$$\mu(\{x \in X \mid s(x) \neq 0\}) \in \mathbb{R}$$

is μ -simple. The set of all μ -simple and Y -valued functions defined on (X, Σ, μ) is denoted by $S(\mu, Y)$.

Clearly every μ -simple function is strongly measurable and p -th power μ -integrable. Moreover, μ -simple functions are closed under \mathbb{K} -vector space operations defined on the space of strongly measurable functions. Hence $S(\mu, Y) \subseteq L^p(\mu, Y)$ is a \mathbb{K} -linear subspace.

Theorem 7.9. Let (X, Σ, μ) be a space with measure. For each $f \in L^p(\mu, Y)$ there exists a sequence $\{s_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ of μ -simple functions and a nonnegative, measurable function g such that the following assertions hold.

(1)

$$\int_X g d\mu \in \mathbb{R}$$

(2) $\|s_n\|^p \leq g$ for every $n \in \mathbb{N}$.

(3) $\{s_n\}_{n \in \mathbb{N}}$ converges pointwise to f .

Proof. By Theorem 6.6 there exists a sequence $\{s_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ of measurable functions pointwise convergent to f such that $s_n(X)$ is finite and the inequality

$$\|s_n - f\| \leq \|f\|$$

holds for every $n \in \mathbb{N}$. Let $g = 2^{p+1} \cdot \|f\|^p$. Then

$$\int_X g d\mu \in \mathbb{R}$$

Moreover, for every $n \in \mathbb{N}$ we have $\|s_n\|^p \leq g$. Hence s_n is μ -simple for every $n \in \mathbb{N}$. This completes the proof of the theorem. \square

Corollary 7.10. *The space $S(\mu, Y)$ is a dense \mathbb{K} -linear subspace of $L^p(\mu, Y)$.*

Proof. This is an immediate consequence of Theorems 7.7 and 7.9. \square

8. BOCHNER'S INTEGRAL

In this section \mathbb{K} is either field \mathbb{R} or \mathbb{C} with their usual absolute values.

Definition 8.1. Let Y be a Banach space over \mathbb{K} and let (X, Σ, μ) be a space with measure. For every $s \in S(\mu, Y)$ we define

$$\int_X s \, d\mu = \sum_{y \in Y} y \cdot \mu(s^{-1}(y))$$

and we call it the *integral* of s with respect to μ .

Fact 8.2. *Let Y be a Banach space over \mathbb{K} and let (X, Σ, μ) be a space with measure. Then*

$$S(\mu, Y) \ni s \mapsto \int_X s \, d\mu \in Y$$

is a \mathbb{K} -linear operator such that

$$\left\| \int_X s \, d\mu \right\| \leq \|s\|_1$$

Proof. We left the proof (direct calculation) for the reader as an exercise. \square

Let Y be a Banach space over \mathbb{K} and let (X, Σ, μ) be a space with measure. By Theorem 7.9 space $S(\mu, Y)$ is a dense \mathbb{K} -linear subspace of $L^1(\mu, Y)$. By Theorem 7.6 space $L^1(\mu, Y)$ is complete and by Fact 8.2 operator

$$S(\mu, Y) \ni s \mapsto \int_X s \, d\mu \in Y$$

is a \mathbb{K} -linear operator with norm equal to one. These imply that there exists a unique \mathbb{K} -linear operator

$$L^1(\mu, Y) \ni f \mapsto \int_X f \, d\mu \in Y$$

with norm equal to one extending the integral on $S(\mu, Y)$.

Definition 8.3. Let Y be a Banach space over \mathbb{K} and let (X, Σ, μ) be a space with measure. The operator

$$L^1(\mu, Y) \ni f \mapsto \int_X f \, d\mu \in Y$$

is called the *Bochner's integral* with respect to μ . For every $f \in L^1(\mu, Y)$ element

$$\int_X f \, d\mu \in Y$$

is called the *integral* of f with respect to μ .

Definition 8.4. Elements of $L^1(\mu, Y)$ are called μ -integrable functions with values in Y .

We prove now some properties of Bochner's integral. We start with noting the following.

Corollary 8.5. Let Y be a Banach space over \mathbb{K} and let (X, Σ, μ) be a space with measure. Suppose that $\{f_n : X \rightarrow Y\}_{n \in \mathbb{N}}$ is a sequence of μ -integrable functions convergent in $L^1(\mu, Y)$ to some μ -integrable function $f : X \rightarrow Y$. Then

$$\lim_{n \rightarrow +\infty} \int_X f_n d\mu = \int_X f d\mu$$

in Y .

Proof. By definition Bochner's integral is continuous with respect to $\|\cdot\|_1$. □

Next we discuss linearity and convexity of integral.

Proposition 8.6. Let (X, Σ, μ) be a space with measure. Let Y, Z be Banach spaces over \mathbb{K} and let $T : Y \rightarrow Z$ be a \mathbb{K} -linear and continuous map of Banach spaces. Then the following assertions hold.

(1) T induces a \mathbb{K} -linear and continuous map

$$L^1(\mu, Y) \ni f \mapsto T \cdot f \in L^1(\mu, Z)$$

(2) The formula

$$\int_X T \cdot f d\mu = T \left(\int_X f d\mu \right)$$

holds for every $f \in L^1(\mu, Y)$.

Proof. Note that

$$\|T \cdot f\|_1 = \int_X \|T \cdot f\| d\mu \leq \int_X \|T\| \cdot \|f\| d\mu \leq \|T\| \cdot \int_X \|f\| d\mu = \|T\| \cdot \|f\|_1$$

for every $f \in L^1(\mu, Y)$. This proves that (1) holds.

For the proof of (2) we fix a μ -simple function $s \in \mathcal{S}(\mu, Y)$. Then we have $T \cdot s \in \mathcal{S}(\mu, Z)$ and

$$\begin{aligned} \int_X T \cdot s d\mu &= \sum_{z \in Z} z \cdot \mu \left(s^{-1} \left(T^{-1}(z) \right) \right) = \sum_{z \in Z} z \cdot \sum_{T(y)=z} \mu \left(s^{-1}(y) \right) = \\ &= \sum_{z \in Z} \sum_{T(y)=z} T(y) \cdot \mu \left(s^{-1}(y) \right) = \sum_{y \in Y} T(y) \cdot \mu \left(s^{-1}(y) \right) = \\ &= T \left(\sum_{y \in Y} y \cdot \mu \left(s^{-1}(y) \right) \right) = T \left(\int_X s d\mu \right) \end{aligned}$$

Hence for every $s \in \mathcal{S}(\mu, Y)$ we have

$$\int_X T \cdot s d\mu = T \left(\int_X s d\mu \right)$$

Theorem 7.9 together with (1) and continuity of integral with respect to μ imply that

$$\int_X T \cdot f d\mu = T \left(\int_X f d\mu \right)$$

for every $f \in L^1(\mu, Y)$. □

Proposition 8.7. Let Y be a Banach space over \mathbb{K} and let (X, Σ, μ) be a space with measure. Suppose that C is a convex subset of Y . Let $f \in L^1(\mu, Y)$ be a function such that $\mu(f^{-1}(C))$ is positive. Then

$$\frac{1}{\mu(f^{-1}(C))} \cdot \int_{f^{-1}(C)} f d\mu \in \mathbf{cl}(C)$$

Proof. Denote by c the mean value in question. If $c \notin \mathbf{cl}(C)$, then according to separation theorem proved in [Monygham, 2023] there exists an \mathbb{R} -linear continuous map $g : Y \rightarrow \mathbb{R}$ and $y \in Y$ such that we have $g(c - y) \subseteq \mathbb{R}_-$ and $g(\mathbf{cl}(C) - y) \subseteq \mathbb{R}_+$. Since $\mu(f^{-1}(C))$ is positive, we have

$$\frac{1}{\mu(f^{-1}(C))} \cdot \int_{f^{-1}(C)} g \cdot f d\mu > g(y)$$

On the other hand according to Proposition 8.6 we derive that

$$\frac{1}{\mu(f^{-1}(C))} \cdot \int_{f^{-1}(C)} g \cdot f d\mu = g \left(\frac{1}{\mu(f^{-1}(C))} \cdot \int_{f^{-1}(C)} f d\mu \right) = g(c) < g(y)$$

This is a contradiction. Thus $c \in \mathbf{cl}(C)$. \square

9. LEBESGUE INTEGRAL OF SCALAR FUNCTIONS

First we compare Bochner's integration with Lebesgue's integration of nonnegative functions. We introduce precise terminology.

Definition 9.1. Let X be a set and let $f : X \rightarrow \mathbb{C}$ be a function. If $f(x) \in \mathbb{R}$ for every $x \in X$, then we say that f is *real valued*.

As careful reader may notice there is certain ambiguity in theory developed so far. Indeed, if (X, Σ, μ) is a space with measure and $f : X \rightarrow \mathbb{C}$ is a nonnegative and μ -integrable on (X, Σ, μ) , then we have a twofold interpretation of

$$\int_X f d\mu$$

Firstly, if we consider f as a nonnegative and measurable function on X , then we may consider integral of this nonnegative function described as in Section 4. On the other hand it may be considered as the Bochner integral of f with respect to μ as defined in Section 8. We explain now why these two numbers are equal. For this note that there is no ambiguity in definitions of simple functions and their integrals between Section 4 on the one hand and Sections 7, 8 on the other. By Proposition 3.6 there exists a nondecreasing sequence of nonnegative and μ -simple functions $\{s_n : X \rightarrow \mathbb{C}\}_{n \in \mathbb{N}}$ which is pointwise convergent to f . By Theorem 4.6 we have

$$\int_X f d\mu = \lim_{n \rightarrow +\infty} \int_X s_n d\mu$$

where we understand the left hand side as the integral in the sense of Section 4. On the other hand by Theorem 7.7 the sequence $\{s_n\}_{n \in \mathbb{N}}$ converges to f also in $L^1(\mu, \mathbb{C})$. Hence by Corollary 8.5 we deduce that

$$\int_X f d\mu = \lim_{n \rightarrow +\infty} \int_X s_n d\mu$$

where we understand the left hand side as the Bochner integral of f with respect to μ . Thus the two numbers are equal.

Let (X, Σ, μ) be a space with measure. In case of \mathbb{C} or \mathbb{R} valued μ -integrable function f on X its Bochner integral

$$\int_X f d\mu$$

is also called the Lebesgue integral of f with respect to μ .
